BUSINESS

VII Executive Summary

VII is the intelligence layer between video and action.

Organizations already have cameras across security, operations, logistics, healthcare, and public infrastructure. What they lack is a system that can turn those camera feeds into structured operational understanding without requiring humans to watch everything manually.

The Problem

Most video systems are still built around storage and playback. That means teams discover important events late, investigate slowly, and extract almost no reusable intelligence from the footage they already have.

Traditional video analytics often make this worse by offering narrow detections, brittle rules, or heavyweight custom projects. The result is a lot of video, a lot of alerts, and not enough understanding.

The VII Approach

VII ingests video from existing sources, interprets scenes with modern vision-language models, and turns the results into structured events, searchable context, summaries, and alerts.

The product starts where the pain is clearest:

- **Security & Surveillance** as the launch wedge
- **Warehouse & Logistics** as the next-ready proof of the same platform in an operational setting

Why It Resonates

- Buyers get more value from infrastructure they already own
- Teams move from passive monitoring to active awareness
- Investigations become faster because the system already structured the event
- Privacy and deployment choices remain with the customer

Deployment Posture

VII is designed for controlled environments as well as managed ones. The product can support cloud, on-premise, and tightly governed deployment models depending on the buyer's needs and security posture.

Strategic Value

VII is not a single vertical point solution. The same core platform can support multiple operating contexts while keeping one underlying model for ingest, interpretation, search, and alerting.

That is what makes the company strategically interesting: a focused launch path with a broader platform upside.
