

Retail Intelligence One-Pager

A concise brief on queue awareness, customer flow, and loss-prevention intelligence from existing store cameras.

VII for Retail Intelligence

Retailers already have video across entrances, aisles, and checkout. What they usually do not have is a clean way to turn that video into operational intelligence.

VII helps retail teams understand flow, friction, and exception patterns from the camera network they already operate.

The Current Gap

- Queue pain is seen too late
- Store managers have limited visibility into movement and dwell patterns
- Loss-prevention teams review too much after the fact
- Analytics often require extra sensors or fragmented tooling

What VII Changes

- Gives teams better awareness of queue build-up and flow patterns
- Turns visible behavior into clearer operational signals
- Supports faster review of loss-prevention scenarios
- Helps stores learn from footage instead of just storing it

Why It Works

VII is valuable where the camera network already exists but the intelligence layer does not. Instead of deploying another isolated analytics product, teams get a broader platform that can support both operational and security use cases.

Best Fit

VII fits multi-site retailers, higher-footfall environments, and teams trying to improve queue awareness, store flow, and exception handling from current infrastructure.
