

# Warehouse & Logistics One-Pager

A focused brief on turning warehouse footage into safety, congestion, and throughput intelligence.

WAREHOUSE

---

## VII for Warehouse & Logistics

Warehouses are full of operational signals that are already visible on camera and almost never structured in time to matter.

VII helps warehouse and logistics teams turn those signals into usable operational awareness. The same intelligence layer that helps a security team catch risk events can help an operations team understand congestion, blocked zones, unsafe movement, and slow handoffs.

### The Operational Gap

- Congestion builds before anyone escalates it
- Forklift and pedestrian interactions are reviewed too late
- Dock activity is visible but not structured
- Teams still rely on radio chatter and manual walkthroughs for basic awareness

### What VII Changes

VII turns warehouse footage into operational intelligence.

- Highlights blocked aisles, staging-zone exceptions, and prolonged congestion
- Surfaces dock occupancy and trailer-turn patterns
- Helps supervisors review safety and throughput issues from the same system
- Creates a searchable history of exceptions and slowdowns

### What Teams Get

- Faster awareness of bottlenecks
- Better understanding of how the floor is actually operating
- A cleaner path from observation to action
- More value from current cameras without another sensor project

## Why This Matters Strategically

Warehouse proves that VII is not just a security product. It shows the platform can move from threat detection into operational intelligence while staying grounded in the same core system.

## Best Fit

VII fits high-volume facilities, fulfillment operations, yard and dock environments, and teams that need to improve safety and throughput without waiting for a long analytics rollout.
